presents papers from the third conference on computational models of argument held in september 2010 in desanzano del garda italy providing a view of this important research field this book is of interest to

those involved in the use and development of artificial intelligence systems

argumentation is all around us letters to the editor often make points of consistency and why is one of the most frequent questions in language asking for reasons behind behaviour and argumentation is more than reasoning in the recesses of single minds since it crucially involves interaction it cements the coordinated social behaviour that has allowed us in small bands of not particularly physically impressive primates to dominate the planet from the mammoth hunt all the way up to organized science this volume puts argumentation on the map in the field of artificial intelligence this theme has been coming for a while and some famous pioneers are chapter authors but we can now see a broader systematic area emerging in the sum of topics and results as a logician I find this intriguing since I see AI as logic continued by other means reminding us of broader views of what my discipline is about logic arose originally out of reflection on many agent practices of disputation in Greek antiquity but also in India and China and logicians like me would like to return to this broader agenda of rational agency and intelligent interaction of course Aristotle also gave us a formal systems methodology that deeply influenced the field and eventually connected up happily with mathematical proof and foundations

the investigation of computational models of argument is a rich and fascinating interdisciplinary research field with two ultimate aims the theoretical goal of understanding argumentation as a cognitive phenomenon by modeling it in computer programs and the practical goal of supporting the development of computer based systems able to engage in argumentation related activities with human users or among themselves the biennial international conferences on computational models of argument COMMA provide a dedicated forum for the presentation and discussion of the latest advancements in the field and cover both basic research and innovative applications this book presents the proceedings of COMMA 2020 due to the COVID-19 pandemic COMMA 2020 was held as an online event on the originally scheduled dates of 8-11 September 2020 organised by the University of Perugia Italy the book includes 28 full papers and 13 short papers selected from a total of 78 submissions the abstracts of 3 invited talks and 13 demonstration abstracts the interdisciplinary nature of the field is reflected and contributions cover both theory and practice theoretical contributions include new formal models the study of formal or computational properties of models designs for implemented systems and experimental research practical papers include applications to medicine law and criminal investigation chatbots and online product reviews the argument mining trend from previous COMMA's is continued while an emerging trend

this year is the use of argumentation for explainable ai the book provided an overview of the latest work on computational models of argument and will be of interest to all those working in the field

focuses on the aim to develop software tools to assist users in constructing and evaluating arguments and counterarguments and or to develop automated systems for constructing and evaluating arguments and counterarguments this book includes articles which provide a snapshot of research questions in the area of computational models of argument

efficient computation of argumentation semantics addresses argumentation semantics and systems introducing readers to cutting edge decomposition methods that drive increasingly efficient logic computation in ai and intelligent systems such complex and distributed systems are increasingly used in the automation and transportation systems field and particularly autonomous systems as well as more generic intelligent computation research the series in intelligent systems publishes titles that cover state of the art knowledge and the latest advances in research and development in intelligent systems its scope includes theoretical studies design methods and real world implementations and applications the series publishes titles in three core sub topic areas intelligent automation intelligent transportation systems and intelligent computing the first book to cover new methods for computing static dynamic and partial argumentation systems methods are applicable to development of systems and research areas in both ai and broader intelligent systems provides the ai and is community with insight into the critical field of efficient computation with a focus on intelligent automation intelligent transportation systems and intelligent computing

this volume presents a selection of papers reflecting key theoretical issues in argumentation theory its six sections are devoted to specific themes including the analysis and evaluation of argumentation argument schemes and the contextual embedding of argumentation the section on general perspectives on argumentation discusses the trends of empiricalization contextualization and formalization offers descriptions of the analytical and evaluative tools of informal logic and highlights selected principles that argumentation theorists do and do not agree upon in turn the section on linguistic approaches to argumentation focuses on the problem of distinguishing between explanation and argument while also elaborating on the role of verbal indicators of argument schemes all essays included in this volume point out notable recent developments in the study of argumentation
